MPsrch\_pp protein - protein database search, using Smith-Waterman algorithm

Tabular output not generated. Run on: Tue Sep 26 16:14:59 2000; MasPar time 9.09 Seconds 606.971 Million cell updates/sec

Description: Perfect Score: Title:

Sequence: >US-09-308-435-2 (28-260) from US09308435.pep 1594 1 CSPHIIETNEVALKLNYHPA.....QKNLESYQKDAKELKGKRNR 233

PAM 150 Gap 11

Scoring table:

Searched: 188963 seqs, 23686106 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: a-geneseq36 1:geneseqp

Statistics: Mean 32.420; Variance 175.543; scale 0.185

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

as vaccine formulations, elicit a protective immune response against H. pylori infections, and are suitable for therapeutic and prophylactic use. An adequate response is produced even without adjuvant. A second 29 kDa antigen (see W60157) is provided that differs only at residue 222 (Arg for Ser).		ylori, lates late of	Claim 6; Page 28-30; 51pp; English.  This polypeptide comprises a 29 kDa surface antigen which is expressed on the surface of both dividing (bacillary) and resting (colloid) forms of Helicobacter pylori. The antigen gives rise to both systemic and local (mucosal) production of antibodies. It is		M60156; standard; Protein; 260 AA. W60156; Standard; Frotein; Standard;

Claim 2; Page 34-35, 49pp; English.
A 29 kDa antigen (W07449) of Helicobacter pylori is an adhesin expressed on the surface of resting and dividing forms of the bacterium. It is conserved in all tested strains of H. pylori, and gives rise to both systemic and local (mucosal) produ. of antibodies. Its amino acid sequence was deduced from a cDNA clone (T43834); a sequence (W0750) deduced from a second cDNA clone (T43834); a sequence (W0750) deduced from a second cDNA clone antipen can be produced in transformed host cells. It is useful for the diagnosis and treatment of H. pylori infections and for

This sequence represents the fusion protein of the invention, between the third sequence represents the fusion protein of the invention, between the This sequence represents the diagnosis of and as a vaccine against the protein is used in the diagnosis of and as a vaccine against the pylori, which is the main cause of gastritis and gastric/duodenal culcers. It may also be used in the production of an anti-H. pylori antibody. Vectors containing the DNA sequence and E. coli strains containing it form the basis of a process to produce the protein, which consists of culturing the microorganism and obtaining the protein. The protein is an effective vaccine against H. pylori due to its excellent immunogenicity for H. pylori, stability within the stomach environment, and its ability to penetrate through the stomach mucous membrane to stimulate sigh production.

                                                                                                                                                                                                                                                                                                                                                                                                           Ψ.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This polypeptide comprises a 29 kDa surface antigen which is expressed on the surface of both dividing (bacillary) and resting (colloid) forms of Helicobacter pylori. The antigen gives rise to both systemic and local (mucosal) production of antibodies. It is an adhesin that is conserved in all tested strains of H. pylori. and is also a putative virulence factor. The invention relates to a new pharmaceutical composition comprising a lipid aggregate of a negatively charged lipid or lipid mixture and at least one antigento, mative or recombinant antigen of H. pylori, preferably the surface-exposed 29 kDa antigen, or a nucleic acid (see V34643) coding for such an antigen. The new formulations, which are useful as vaccine formulations, elicit a protective immune response against H. pylori infections, and are suitable for therapeutic and prophylactic use. An adequate response is produced even without adjuvant. A second, claimed 29 kDa antigen (see W60156) is provided that differs only at residue 222 (Ser for Arg).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

CA 29 kDa antigen (W07450) of Helicobacter pylori is an adhesin conserved in all tested strains of H. pylori, and gives rise to both systemic and local (mucosal) prodn. of antibodies. Its amino acid sequence was deduced from a cDNA clone (T43834) differs only at position 222 (Ser for Arg). Recombinant antigen can be produced in transformed host cells. It is useful for the diagnosis and treatment of H. pylori infections and for use as a vaccine.
          Recombinant or substantially pure preparations of H. pylori polypeptides are disclosed, together with the nucleic acids encoding them. In all, 73 OREs are shown. The proteins are variously cell envelope proteins, secreted proteins or other cellular proteins. Vaccines containing the nucleic acids or proteins are claimed, as are probes containing at least 8 nucleotides from the nucleic acid sequences. The vaccines are useful for treating or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H. pylori infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                08-JUN-1999 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ş
                                                                                                                                                                                                                                      Pf Helicobacter pylori nucleic acid sequences and related prolypeptide(s) - useful for vaccines to treat or prevent H. pylori infection, and to detect Helicobacter Snglish.

Claim Scauence represents a H. pylori protein.

Claim Fertion or to identify H. pylori polypeptide binding compounds, competing the protein may be used in a vaccine to prevent or treat H. pylori claim fection or to identify H. pylori polypeptide binding compounds, competing sequence of H. pylori (ATCC 55679) was determined from coverlapping contigs generated by mechanically shearing the bacterial coverlapping contigs generated by mechanically shearing the bacterial contint of the sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To confort itself H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁

                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC This sequence represents an H. pylori derived protein, no further CC details are given in the specification.

CC Helicobacter pylori has been strongly linked to chronic gastritis and CC duodenal ulcer disease. The nucleic acid sequences of the invention CC are used to evaluate compounds, especially activators or inhibitors of CC bacterial life cycle, for the ability to bind an H. pylori nucleic acid sequence. The nucleic acid sequences, and corresponding proteins, are CC sequence. The nucleic acid sequences, and corresponding proteins are CC used to inhibit expression of a gene from Helicobacter species in CC a sample. Antisense nucleic acid sequences of these sequences are used to inhibit expression of a gene from Helicobacter species. H. CC pylori whole genomic DNA was isolated and nebulised to a median size of Exti-linker adapters in 100-1000 fold molar excess. These linkers are CC complementary to the BstXI-cut pMPX vectors, while the overhang is not complementary. Therefore the linkers will not concatemerise nor CC will the cut vector re-ligate itself easily. The linker-adapter inserts were ligated to each of the 20 pMPX vectors to construct a series of construct as co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT

Care given in the specification.

Care given in the specification.

Care protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, insertion or to identify H. pylori polypeptide binding compounds, insertion or to identify H. pylori polypeptide binding compounds, inserting the protein may be used in a vaccine to prevent or treat H. pylori (ATCC 55679) was determined from the genomic sequence of H. pylori (ATCC 55679) was determined from the genomic sequences were analysed for ORF of at least 180 nucleotides, in the sequences were analysed for ORF of at least 180 nucleotides, in the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.

       Helicobacter pylori nucleic acid sequences and encoded polypeptide(s) - useful in vaccines to treat or prevent H. pylori infection and for diagnosis of H. pylori infection Claims 14,80; Page 653; 1145pp; English.

This sequence is a H. pylori cell envelope outer membrane protein (The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors.

DNA and probes derived from it may be used for the identification o

Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of H. pylori-specific antigens. The genomic sequence of H. pylori (AFCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli
     Helicobacter pylori nucleic acid sequences and encoded polypeptide(s) - useful in vaccines to treat or prevent H. pylori polypeptide(s) - useful in vaccines to treat or prevent H. pylori infection and for diagnosis of H. pylori infection.

Claim 14, pages 558-559, 1145pp, English.

This sequence is a H. pylori protein of unspecified function.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The pylori in a sample and the diagnosis of H. pylori infection. Nucle

                                                                                                           New isolated Helicobacter polynucleotides - used to develop products for the diagnosis, prevention and treatment of Helicobacter infections and gastrointestinal diseases Claim 8; Page 455-456; 2054pp; English.

This sequence represents a Helicobacter pylori GHPO protein of the invention. The polypeptides can be used for preventing or treating Helicobacter infections, and gastroduodenal diseases associated with these infections, including acute, chronic, and atrophic gastritis, and peptic ulcer diseases, e.g. gastric and duodenal ulcers. They can also used for the production of antibodies. The products can also be used for the production of antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         H. pylori GHPO 1615 protein.

Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of H. pylori-specific antigens. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amblificant in a pylori by PCR.
                                                                                                                                                                                                                                                                                                                                               (HDWA-) HUMAN GENOME SCI INC.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Recombinant or substantially pure preparations of H. pylori polypeptides are disclosed, together with the nucleic acids encoding them. In all, 73 ORFs are shown. The proteins are variously cell envelope proteins, secreted proteins or other cellular proteins. Vaccines containing the nucleic acids or proteins are claimed, as are probes containing at least 8 nucleic acids from the nucleic acid sequences. The vaccines are useful for treating or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H. pylori infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claims 27, 31; Page 151; 279pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vaccine; probe; diagnostic; UKF; CE secreted protein; cellular protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             T 13

PT infection, and to detect Helicobacter

PS Claim 72; Page 1333-1334; 1481pp; English.

CC The present sequence is a H. pylori secreted or periplasmic protein.

CC The protein may be used in a vaccine to prevent or treat H. pylori

CC infection or to identify H. pylori polypeptide binding compounds,

CC useful as potential H. pylori life cycle activators or inhibitors.

CC useful as potential H. pylori (ATCC 55679) was determined from

CC overlapping contigs generated by mechanically shearing the bacterial

CC not the sequences were analysed for ORF of at least 180 nucleotides,

CC identify likely H. pylori antigens for vaccine development, the amino

CC acid sequences predicted from various ORF were analysed for significant

CC homology to other known or exported membrane proteins. Having identified

CC and determined the sequences of interest, particular regions can be

isolated from H. pylori by PCR amplification for recombinant polypeptide

CC production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Best Loc

PT Helloobacter pylori nucleic acid sequences and related PT polypeptide(s) - useful for vaccines to treat or prevent H. pylori PT infection, and to detect Helloobacter
PS Claim 72; Page 638; 1481pp; English.

CC The protein may be used in a vaccine to prevent or treat H. pylori CC infection or to identify H. pylori polypeptide binding compounds, CC useful as potential H. pylori life cycle activators or inhibitors.

CC The genomic sequence of H. pylori (ATCC 55679) was determined from coverlapping contigs generated by mechanically shearing the bacterial CC DNA. The sequences were analysed for ORF of at least 180 nucleotides, CC and the predicted coding regions defined by computer evaluation. To composite the predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified colored the sequences of interest, particular regions can be colored from H. pylori by PCR amplification for recombinant polypeptide sequence 147 AA;

Statistics: Mean 46.291; Variance 102.838; scale 0.450

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Release 3.1A John F. Collins, Biocomputing Research Unit. Copyright (c) 1993-1998 University of Edinburgh, U.K. Distribution rights by Oxford Molecular Ltd

Run on: .Psrch\_pp protein - protein database search, using Smith-Waterman algorithm

Tabular output not generated. Tue Sep 26 16:18:57 2000; MasPar time 8.99 Seconds 613.770 Million cell updates/sec

Title:
Description:
Perfect Score:
Sequence: >US-09-308-435-4 (28-260) from US09308435.pep 1599

1 CSPHIIETNEVALKLNYHPA.....QKNLESYQKDAKELKGKRNR 233

Searched: PAM 150 Gap 11

Scoring table:

188963 seqs, 23686106 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: a-geneseq36 1:geneseqp

Statistics: Mean 32.470; Variance 175.985; scale 0.185

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                         ps Disclosure; Page 35-36; 51pp; English.

This polypeptide comprises a 29 kDa surface antigen which is campressed on the surface of both dividing (bacillary) and resting (colloid) forms of Helicobacter pylori. The antigen gives rise to both systemic and local (mucosal) production of antibodies. It is an adhesin that is conserved in all tested strains of H. pylori, and is also a putative virulence factor. The invention relates to negatively charged lipid or lipid mixture and at least one antigenic, native or recombinant antigen of H. pylori, preferably the surface-exposed 29 kDa antigen, or a nucleic acid (see vy4643) coding for such an antigen. The new formulations, which are useful as vaccine formulations, and are suitable for therapeutic and prophylactic use. An adequate response is produced even without adjuvant. A second, claimed 29 kDa antigen (see W60156) is provided that differs only at residue 222 (Ser for Arg).
                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This polypeptide comprises a 29 kDa surface antigen which is cyclested on the surface of both dividing (bacillary) and resting (colloid) forms of Helicobacter pylori. The antigen gives rise to both systemic and local (mucosal) production of antibodies. It is to both systemic and local (mucosal) production of antibodies. It is an adhesin that is conserved in all tested strains of H. pylori, and is also a putative virulence factor. The invention relates to a new pharmaceutical composition comprising a lipid aggregate of a new pharmaceutical composition comprising a lipid aggregate of a negatively charged lipid or lipid mixture and at least one antigenic, native or recombinant antigen of H. pylori, preferably the surface-exposed 29 kDa antigen, or a nucleic acid (see V34642) coding for such an antigen. The new formulations, which are useful as vaccine formulations, elicit a protective immune response against H. pylori infections, and are suitable for therapeutic and prophylactic use. An adequate response is produced even without adjuvant. A second 29 kDa antigen (see W60157) is provided that chiefers only at residue 222 (Arg for Ser).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

CR A 29 kDa antigen (W07449) of Helicobacter pylori is an adhesin expressed on the surface of resting and dividing forms of the bacterium. It is conserved in all tested strains of H. pylori, and gives rise to both systemic and local (mucosal) prodn. of antibodies. Its amino acid sequence was deduced from a cDNA clone (T43834); a sequence (W07550) deduced from a second cDNA clone (T43835) differs only at position 222 (Arg for Ser). Recombinant antigen can be produced in transformed host cells. It is useful for the diagnosis and treatment of H. pylori infections and for series as a vaccine.

     infections (laims 27, 31; Page 207-208; 279pp; English. Claims 27, 31; Page 207-208; 279pp; English. Recombinant or substantially pure preparations of H. pylori polypeptides are disclosed, together with the nucleic acids encoding them. In all, 73 ORFs are shown. The proteins are variously cell envelope proteins, secreted proteins or other cellular proteins. Vaccines containing the nucleic acids or proteins are claimed, as are probes containing at least 8 nucleotides from the nucleic acid sequences. The vaccines are useful for treating or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life
                                                                                                                                                                                                                                                                                                                                                                                                                  wPI; 98-271811/24.

It may also be used in the production of an anti-H. pylori antibody. Vectors containing the DNA sequence and E. coli strains containing it form the basis of a process to produce the protein, which consists of culturing the microorganism and obtaining the protein. The protein is an effective vaccine against H. pylori due to its excellent immunogenicity for H. pylori, stability within the stomach environment, and its ability to penetrate through the stomach mucous membrane to
                                                                                                                                                                                                                                                                                                                                                                                                   Helicobacter pylori nucleic acids and proteins -
products for the detection, prevention and treatm

PT infection, and to detect Helicobacter

BS Disclosure; Page 1363-64; 1481pp; English.

CC This sequence represents a H. pylori protein.

CC This sequence represents a H. pylori protein.

CC Infection or to identify H. pylori polypeptide binding compounds,

CC useful as potential H. pylori life cycle activators or inhibitors.

CC The genomic sequence of H. pylori (ATCC 55679) was determined from

CC overlapping contigs generated by mechanically shearing the bacterial

CC DNA. The sequences were analysed for ORF of at least 180 nucleotides,

and the predicted coding regions defined by computer evaluation. To

identify likely H. pylori antigens for vaccine development, the amino

acid sequences predicted from various ORF were analysed for significant

homology to other known or exported membrane proteins. Having identified

CC isolated from H. pylori by PCR amplification for recombinant polypeptide

CC production, e.g. in E. coli hosts.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents an H. pylori derived protein, no further details are given in the specification.

C details are given in the specification.

C Helicobacter pylori has been strongly linked to chronic gastritis and duodenal ulcer disease. The nucleic acid sequences of the invention are used to evaluate compounds, especially activators or inhibitors of bacterial life cycle, for the ability to bind an H. pylori nucleic acid sequences. The nucleic acid sequences, and corresponding proteins, are also useful for generating vaccines for immunising subjects against H. pylori or in the indetecting the presence of Helicobacter species in a sample. Antisense nucleic acid sequences of these sequences are used to inhibit expression of a gene from Helicobacter species. H. pylori whole genomic DNA was isolated and nebulised to a median size of pylori whole genomic DNA was isolated and nebulised to a median size of pylori-linker adapters in 100-1000 fold molar excess. These linkers are complementary to the BstXI-cut pMPX vectors, while the overhang is not self-complementary. Then excepts in the content of the 20 pMPX vectors to construct a series of shotgun subclone libraries. The purified DNA samples were then
                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pf Helicobacter pylori nucleic acid sequences and related problypeptide(s) - useful for vaccines to treat or prevent H. pylori finfection, and to detect Helicobacter

pisclosure; Page 655; 1481pp; English.

The present sequence is a H. pylori derived protein, no further details are given in the specification.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, the protein may be used in a vaccine to prevent or inhibitors.

The protein may be used in a vaccine to prevent or inhibitors.

The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

        Helicobacter pylori nucleic acid sequences and encoded polypeptide(s) - useful in vaccines to treat or prevent H. pylori infection and for diagnosis of H. pylori infection Claims 14,80; Page 653; 1145pp; English.

This sequence is a H. pylori cell envelope outer membrane protein The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors.

DNA and probes derived from it may be used for the identification (

PT polypeptide(s) - useful in vaccines to treat or prevent H. pylori polypeptide(s) - useful in vaccines to treat or prevent T. pylori infection

PT infection and for diagnosis of H. pylori infection

Claim 14; Pages 558-559; 1145pp; English.

CC This sequence is a H. pylori protein of unspecified function.

CC The protein may be used in a vaccine to prevent or treat H. pylori CC infection or to identify H. pylori polypeptide binding compounds, cuseful as potential H. pylori life cycle activators or inhibitors. The CC Useful as potential H. pylori life cycle activators or inhibitors. The CC Useful and probes derived from it may be used for the identification of CC H. pylori in a sample and the diagnosis of H. pylori infection. Nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ş

Nucleic acid sequences complementary to the DNA act as antisense sequences and can be used to prevent the translation of H. pylori mRNA. Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of H. pylori-specific antigens. The genomic sequence of H. pylori (ANCC 5679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

                                                                         New isolated Helicobacter polynucleotides - used to develop products for the diagnosis, prevention and treatment of Helicobacter infections and gastrointestinal diseases Claim 8; Page 455-456; 2054pp; English.

This sequence represents a Helicobacter pylori GHPO protein of the invention. The polypeptides can be used for preventing or treating the inventions, including acute, chronic, and atrophic gastritis, and peptic ulcer diseases, e.g. gastric and duodenal ulcers. They can also be used for the production of antibodies. The products can also be used for the production of antibodies. The products can also be used for the production of antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      acid sequences complementary to the DNA act as antisense sequences and can be used to prevent the translation of H. pylori mRNA. Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of H. pylori-specific antigens. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR ammificant homology can be isolated from H. pylori by PCR ammificant homology to other known or exported membrane proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               peptic ulcer disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Recombinant or substantially pure preparations of H. pylori polypeptides are disclosed, together with the nucleic acids encoding them. In all, 73 ORFs are shown. The proteins are variously cell envelope proteins, secreted proteins or other cellular proteins. Vaccines containing the nucleic acids or proteins are claimed, as are probes containing at least 8 nucleotides from the nucleic acid sequences. The vaccines are useful for treating or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H. pylori infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Helicobacter pylori nucleic acids and proteins - products for the detection, prevention and treatm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    08-JUN-1999 (titel envel)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is a H. pylori secreted or periplasmic protein.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

This sequence represents a H. Pylori secreted or periplasmic protein. CC The protein may be used in a vaccine to prevent or treat H. Pylori infection or to identify H. Pylori polypeptide binding compounds, cc useful as potential H. Pylori life cycle activators or inhibitors. CC The genomic sequence of H. Pylori (ATCC 55679) was determined from coverlapping contigs generated by mechanically shearing the bacterial CC DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To cleantify likely H. Pylori antigens for vaccine development, the amino CC identify likely H. Pylori antigens for vaccine development, the amino CC acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be considered from H. Pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.
